

A large, blue, knitted bear sculpture stands in a grassy field. In the background, several white wind turbines are visible against a hazy, sunlit sky. A few people and a dog are standing near the bear, looking towards the turbines.

Johan Albrecht

Professor
UGent

A family consisting of a man, a woman, and a child is standing in a grassy field. To their left is a large, blue, knitted bear sculpture. In the background, several wind turbines are visible against a bright, hazy sky. A small dog is sitting on the grass in the foreground.

**Residential heating: potential decrease
in CO₂ emissions thanks to Natural Gas**

Setting the scene

- 🌿 **EU CO₂ reduction target (per year):**
 - 🌿 - 1,5% between 2015 and 2030
 - 🌿 - 4,6% between 2030 and 2050
- 🌿 **Buildings in EU;**
 - 🌿 40% energy consumption,
 - 🌿 36% CO₂ emissions
- 🌿 **IEA (2014); decarbonisation of electricity use in buildings is key + *near-term* recommendation to mandate the use of gas condensing boilers**
- 🌿 **Decarbonisation & synchronicity?**
- 🌿 **What to do with expected overproduction of renewable electricity generation (at zero marginal cost)?**

Table 1 – Housing stock with dominant heating technology

	Number (2017, Belgium)	Heating technology	
Apartments	1 300 000	<i>Gas</i>	70%
		<i>Heating oil</i>	20%
		<i>Electricity</i>	10%
Detached houses	1 400 000	<i>Gas</i>	40%
		<i>Heating oil</i>	57%
		<i>Electricity</i>	3%
Semi-detached houses	970 000	<i>Gas</i>	60%
		<i>Heating oil</i>	37%
		<i>Electricity</i>	3%
Terraced houses	1 350 000	<i>Gas</i>	70%
		<i>Heating oil</i>	26%
		<i>Electricity</i>	4%

Potential energy savings and CO₂ reductions

- 🌿 **CO₂ reduction between 40 and 60% achievable by 2050**
- 🌿 **Main drivers;**
 - 🌿 renovation rate +
 - 🌿 depth of renovation +
 - 🌿 CO₂-emissions factor for electricity
- 🌿 **Replacing old heating technologies; cost-effective CO₂ mitigation option (but no radical reduction potential)**
- 🌿 **Renovation loans; on the decline (partly due to price increases of old inefficient houses)**

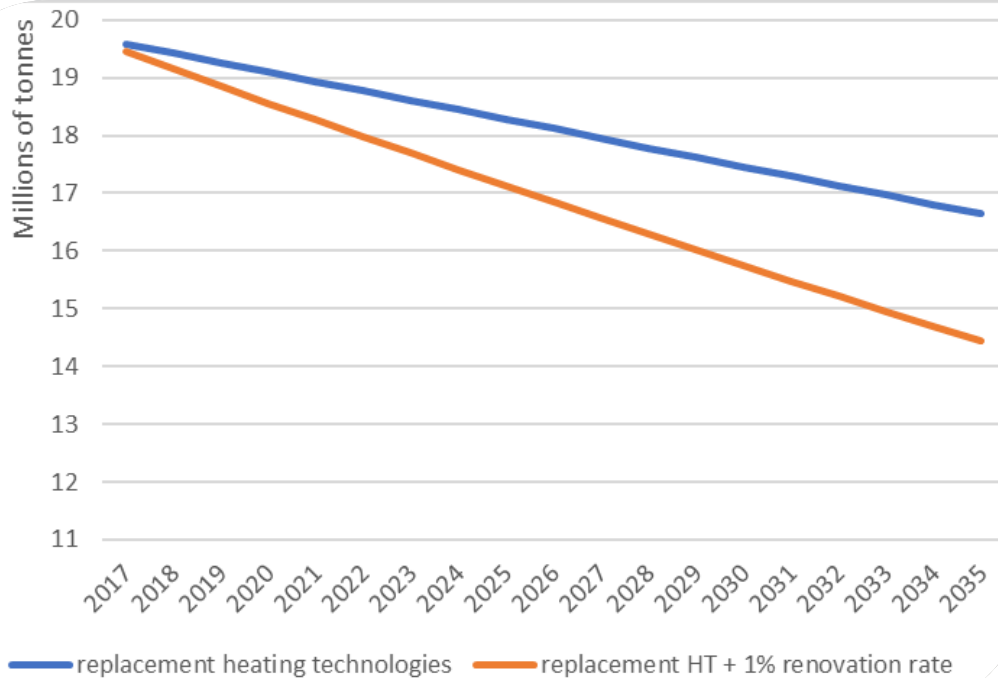

Replacement of heating technologies with/without additional renovation efforts

- 🌿 Replacement ; no switch to other technologies
- 🌿 Switch from heating oil technologies to gas technologies
- 🌿 Switch from heating oil to electricity (& gas to gas)
- 🌿 Switch from heating oil and gas to electricity
- 🌿 4 scenarios with/without additional renovation efforts

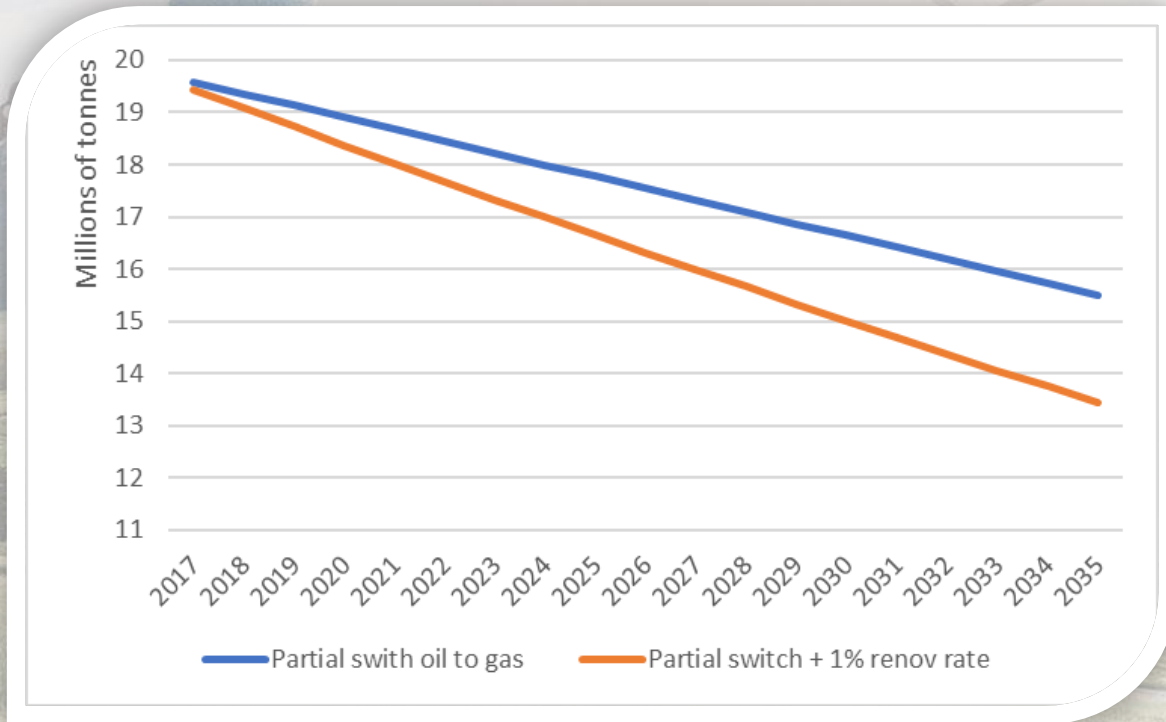

Replacement; no switch to other technologies

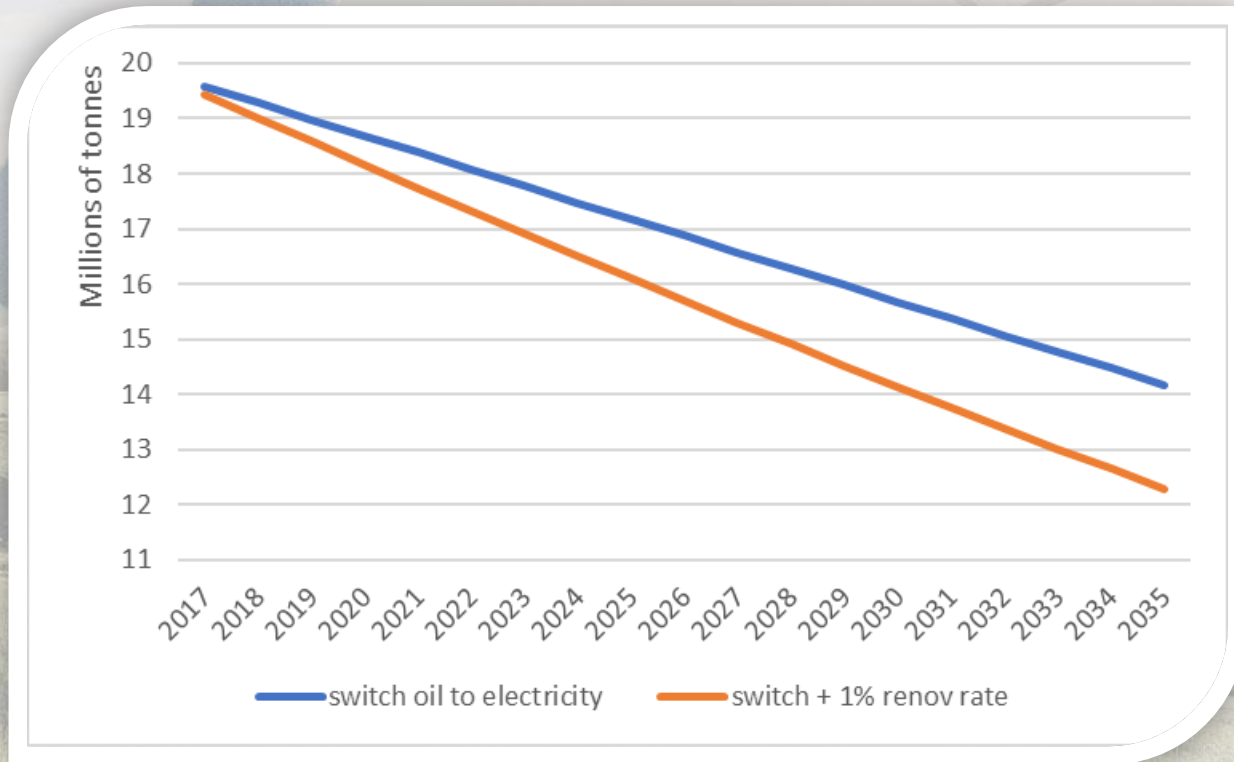

(-14% ; - 26%)

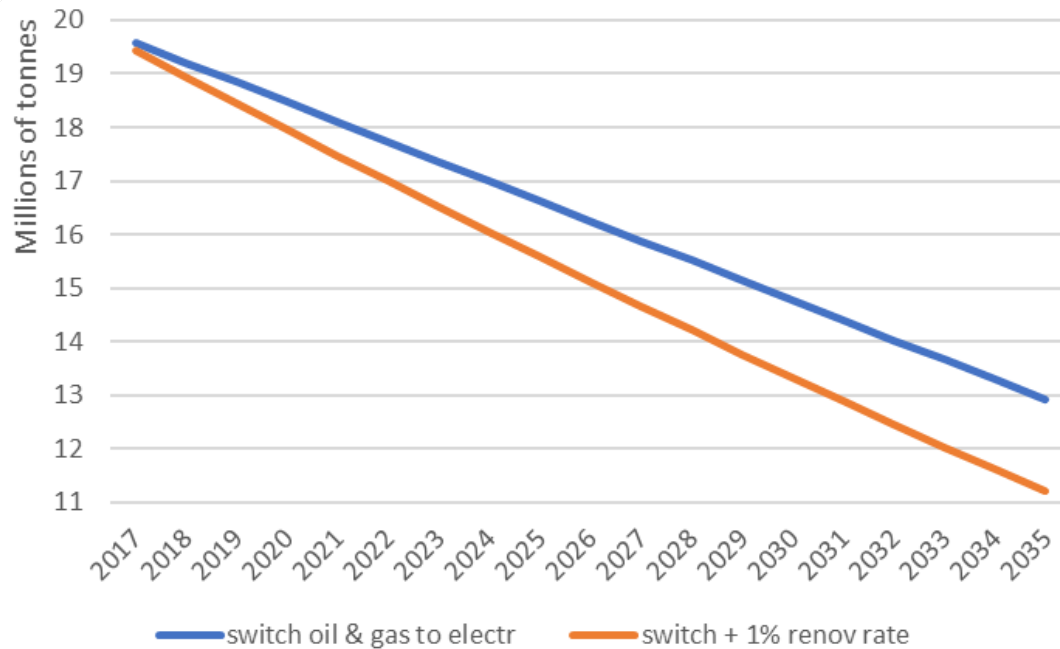

Switch from heating oil technologies to gas technologies (-21%; -32%)

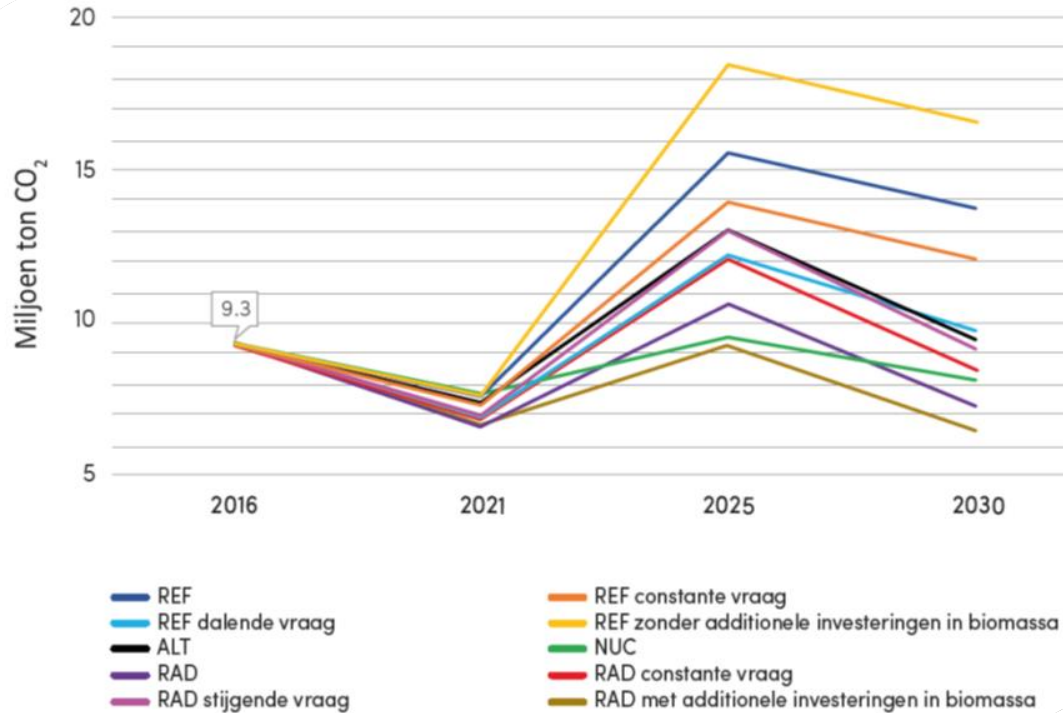

Switch from heating oil to electricity & gas to gas (-28%; -27%)

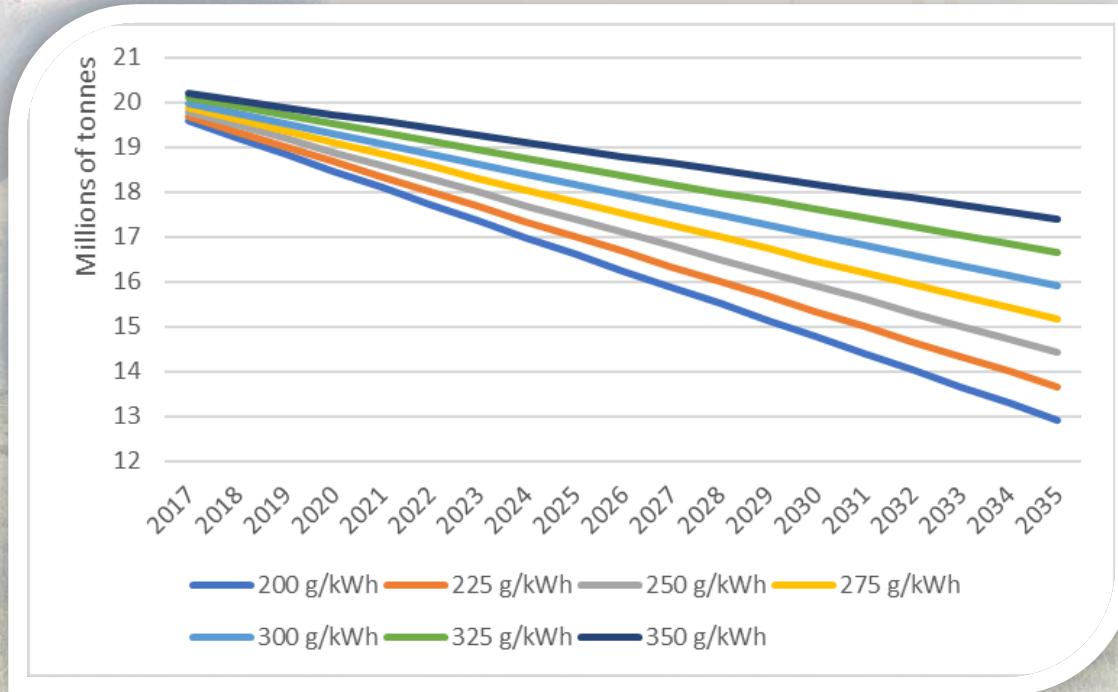

Switch from heating oil and gas to electricity (-34%; -43%)

CO₂-intensity of electricity generation after the (partial) nuclear phase-out?

Variation in CO₂-intensity per kWh and CO₂ emissions of housing stock with only replacement of heating technologies; full switch from heating oil and gas to electricity

Conclusions

- ✿ **Extrapolation of current replacement dynamics yields a reduction of CO₂ emissions of 14,4% / 26% by 2035**
- ✿ **Switch from heating oil technologies to new gas technologies; CO₂ reductions of 21% and 32% (including renovations)**
- ✿ **Although not realistic nor desirable from a cost-effectiveness perspective, higher CO₂ reductions are obtained when all old fossil heating technologies are replaced by new electrical technologies: 34% and 43% respectively.**
- ✿ **However; CO₂-intensity per kWh should not exceed 275 g/kWh after phase-out**
